

GET THE FACTS

COVID-19, Myocarditis, and Vaccines

Myocarditis is inflammation of the heart muscle. This can happen after viral infections like COVID-19 and, very rarely, after receiving mRNA COVID-19 vaccines.

Most people with myocarditis following vaccination recover completely with rest and simple treatment. However, myocarditis from COVID-19 can be very severe.

If you're **UNVACCINATED**:

4X to 8X
higher risk
of myocarditis from
COVID-19 infection
in all ages.

10x
higher risk
of hospitalization
from COVID-19
infection.

If you received the COVID-19 vaccine:

The overall risk of
myocarditis is
EXTREMELY LOW.

1 IN **200,000**

Young males (12-29 yrs)
have a slightly higher
risk, but still **VERY LOW.**

1 IN **14,000**

Young females
(12-29 yrs) have a
MUCH LOWER risk.

LESS THAN 1 IN **100,000**

Don't miss your shot!
Your heart is safer with
COVID-19 vaccines!
